

Variations in barcode printers

With a little technical know-how you can actually use a black and white laser printer as a barcode printer. Although this method can prove to be suitable for small scale situations but it is definitely not suitable for large barcode printing jobs. For this you have a number of options and variations in the kind of devices that can be used for the purpose.

Such stand alone dedicated barcode printers and label printers are produced by different brand names who have been striving to produce the device. Barcode printing is something that requires pin point accuracy because otherwise the barcode scanner will have difficulty in reading it. In accurate printing can result in mixing up your record.

Knowing about the different types on board

Basically there are three main categories of barcode printers. These are based on different kinds of business needs that may arise. Moreover the different devices incorporate different kinds of technology to best cater to the purpose. There is the small office barcode printer also known as the SOHO barcode printers.

These barcode printers are quite cheap to buy but do not have the capability to handle large barcode printing. Basically these kinds of barcode printers are good for occasional barcode printing.

Then you have those dedicated barcode printers that are used for the printing of large batches. These are basically barcode printing powerhouses that have been specifically designed for the purpose of churning out multitudes of prints. Unlike the small office barcode printers such machines are expensive to buy.

But given the function that they perform factories and large retail outlets are in dire need of such devices. These barcode printers have the ability to print large quantities of barcodes at good speed. These printers come in handy when speed and reliability is of utmost importance.

The latest technology has resulted in portable barcode printers. These are basically wireless barcode printers that do not need to be connected or stationed with a computer in order to function. The added dimension of mobility serves many benefits in businesses where situations require such devices.

There is one thing though; most portable barcode printers do not have the capability to print large quantities of barcodes. This is why the most common use of such devices is to print receipts and forms on the spot as required.

Such devices are either wireless or make use of Bluetooth technology. When it comes to wireless technology wireless barcode scanners are extremely useful but wireless barcode printers have limited applications.

Making the choice

Your decision of which barcode printer to go for depends totally on the needs of your business. If you are a small organization that requires occasional printing of barcodes then the small office printer should suffice for your needs.

On the other hand if you require extensive printing of barcodes then you need a machine that is dedicated to printing large quantities at good speed and with great reliability. A portable handheld barcode printer has limited uses but if your business has the need then you can go for it.
