

Chances of Pregnancy after Tubal Reversal

Once decided to go for Tubal Reversal Surgery, you want to know about your pregnancy chances. You must be eager to know as to what are the things that affect your pregnancy after Tubal Reversal. After all the objective of tubal reversal surgery is to get pregnant and to have a child. So you would like to know how fast you can get pregnant and what are the possibilities of you getting pregnant.

You would like to know what factors augment the pregnancy chances in Tubal Reversal and what the prospects of you getting pregnant after undergoing Tubal reversal procedure are.

First factor that matters the most to increase the pregnancy chances is the need to look at your age. You know that age plays a vital role in getting a woman pregnant. A woman is capable to conceive a child at the proper age. Also, a woman who is undergoing for Tubal Reversal procedure will find that her chances of expecting a child reduce with the age. On the other hand, a woman stands a good chance of getting pregnant if she is younger. On the other hand, a woman who is above twenties will have lesser pregnancy chances. And of course, a woman who has crossed forty years of age stands at a very less percentage of conceiving a baby.

Next factor that plays an important part in enhancing pregnancy chances after getting tubal reversal procedure is how long you had the original tube ligation procedure? It is because the longer it has been, the chances of getting the tubes damaged are more. The damage done to the tubes lowers the chances of tubal ligation reversal procedure. However, that does not indicate by any means that you can't be successful; it only means that your chances are somewhat less than others.

Many women have experienced that IVF (vitro fertilization) treatment has been more successful in pregnancy chances than the tubal reversal surgery. In a number of studies that have been carried out for knowing which procedure is the most successful in pregnancy cases, tubal reversal has been found better than IVF.

Also one study revealed that those women who had undergone the treatment from the tubal reversal surgery could conceive more easily. In addition, after they become pregnant, the number of actual babies born was higher in case of tubal reversal treatment rather than in IVF procedure. Moreover, the reversal surgery is usually carried out within about an hour or so whereas IVF treatment can take many trials.

The next factor that accelerates the pregnancy chances depends on the duration of the fallopian tubes left from the original tubes tying procedure. In this case, the more the doctor will work the better outcome shall be produced. All the factors related to the fallopian tubes determine the chances of tubal reversal surgery.

While taking into consideration the factors that determine the pregnancy chances of tubal reversal surgery, you must note that it may not happen immediately and woman may take time to conceive.
